

Abstract of the Disclosure

The lamination apparatus of this invention enables the operator to keep working without paying attention to the remaining length of the laminating film. The lamination apparatus is used to make lamination layers with a transparent or semitransparent laminating film pasted on such printed matters as posters, advertising fliers or computer output media. The laminate apparatus comprise the following systems and units.

Measuring system containing encoder 13 to measure the length of laminate film A pulled out from original roll. Input system 16 for the length of laminate film A set in advance. Calculation system to subtract pulled-out length of laminate film A from that of the original film roll 4. Display unit 17 to indicate the subtracted value of laminate film. Alarm system for issuing a warning when the subtracted value reaches some certain level or less.
